Summary

Arctic Charr, *Salvelinus alpinus* (L.), is a fish species receiving much attention as a candidate for aquaculture development in Canada. Breeding lines of charr are currently being developed at several farms in the Province of Ontario, and seed stock is becoming available to those who wish to "grow-out" fingerlings to market size.

Compared to rainbow trout, there is relatively little published or other readily available literature which provides information on everything from those breeding systems to disease problems which are unique to this species. The following is a brief listing of research publications, popular press articles and consultants' reports which should be useful to anyone wishing to learn more about Arctic charr. Published research papers can be accessed through most University or government libraries, and many materials are becoming available on the internet. Any questions concerning this reference listing can be directed to the Aquaculture Centre, University of Guelph, 519-824-4120 ext. 52689, or email us at aquacntr@uoguelph.ca.
